

++++ Important Facts for Your Election Decision +++++

Health Means Education

Dr. Matthias Rath

For more than a decade, Dr. Rath has been a voice of conscience exposing the global scheme of the pharmaceutical drug Cartel and its unscrupulous "business with disease". Not surprisingly, he has been attacked by the drug Cartel media the world over (www.wiki-rath.org).

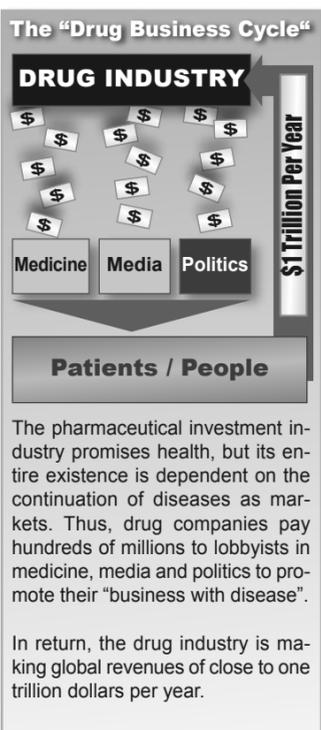

For their civil courage Dr. Rath and his Foundation received the prestigious 'Relay of Life' Award (www.relay-of-life.org) from survivors of Auschwitz and other Nazi concentration camps (www.profit-over-life.org).

The Dr. Rath Research Institute in Santa Clara, California is a world leader in science-based natural approaches to cardiovascular disease and cancer (www.dr-rath-research.org).

All activities of the Dr. Rath group belong to a non-profit parent organization. By taking this decision, he is deliberately paving the way for a new health care system that can finally focus on the prevention of diseases – and is no longer doomed to feed the insatiable greed of the pharmaceutical investment business thriving on the continuation of diseases.

Economic growth, reducing national debt, creating new jobs and controlling health costs are leading topics in the Presidential election campaign. Despite much debate about these topics the key factor affecting all of these problems at the same time has remained obscure. This is even more surprising since this factor can be analyzed and identified with nearly mathematical precision:

1. The single most important factor directly or indirectly determining economic growth, budget deficit, unemployment rate and affordable health – is exploding healthcare costs.
2. The single most important factor driving the skyrocketing healthcare costs are the expenditures for pharmaceutical drugs.
3. If the majority of these drugs would target the prevention and elimination of diseases these expenses may be justifiable because they would eventually lead to fewer diseases – followed by less costs.
4. The facts, however, are the opposite: a). With few exceptions, all prescription drugs currently marketed in the US and

other countries do not address or eliminate the root cause of diseases, they – at best – ameliorate symptoms. b) More than 40% of the prescription drugs currently taken by patients in the US are potentially carcinogenic – i.e. they can cause cancer. c) The known deadly side-effects of prescription drugs in the US are the third leading cause of death, surpassed only by mortalities from cardiovascular diseases and cancer.

A case in point is chemotherapy applied to cancer patients - allegedly to control cancer. The most frequent side-effect of chemotherapy, however, is the generation of new cancer – due to the toxicity of these drugs.

5. The explanation for all these facts is straightforward: The pharmaceutical industry is a giant investment industry that has defined diseases as markets. Worse,

the entire existence of this industry is based on promoting and expanding these markets – i.e. diseases.

6. To mask this giant deception – offering health but promoting diseases – the drug industry has been hiring lobbyists in all areas of society, including medicine, media and politics.
7. Particularly devastating is the role of politicians that are politically or financially entangled with these interests. Mandated to protect the health of their constituency, they are tempted to promote the "business with disease" instead.

In the context of the forthcoming elections you should know the following facts:

- Mitt Romney, through his investment funds, owns shares in and profits from drug giants like Pfizer and Merck, as well as Mylan and Watson Pharmaceuticals.
 - His running mate Paul Ryan's wife Janna has even worked as a paid corporate lobbyist for the pharmaceutical drug industry in Washington D.C.
- Just imagine what will happen to your health and your health care bill if they enter the White House.

The Laws of the Pharmaceutical Industry

1. The pharmaceutical industry is not a health industry, but an investment business. Its primary focus is not to increase the health of the people – but the shareholder value of its owners.
2. The pharmaceutical industry – but an artificially created investment business launched more than a century ago by globally operating financial groups.
3. The defined market place of the pharmaceutical industry is our body – but only as long as it is sick.
4. The continuation and expansion of diseases as drug markets is the precondition for the continued growth of the pharmaceutical investment "business with disease."
5. The key legal tools and economic instruments on which this multi-trillion dollar investment industry is built are patents. They allow the drug makers the arbitrary fixing of their own mark-ups ("royalties") for a new drug which are a driving factor for exploding health care costs.
6. Because patents are only granted for new, synthetic molecules, the drug industry focuses its research on developing synthetically designed, patented chemicals – and markets them as prescription drugs.
7. Most of these chemical substances are unknown to the human body which considers these 'foreign' substances as toxins

8. In order not to endanger their multi-trillion dollar disease markets, the pharmaceutical companies almost exclusively develop drugs that merely ameliorate symptoms – but hardly ever correct the root cause of diseases.
9. Based on this deceptive strategy, the investment circles behind the pharmaceutical investment business have been able to portray themselves as global "purveyors of health" – while, in fact, thriving on the promotion of diseases as the basis of multi-trillion dollar drug markets.
10. Thus, by its very nature – the pharmaceutical business model is a giant fraud: It promises health to the people and the governments of the world but its entire existence depends on the continuation of the "business with disease".
11. This principle is the reason why today's most common diseases, including cardiovascular disease and cancer continue in epidemic proportions.
12. To disguise the deceptive nature of the pharmaceutical business the drug companies maintain an army of lobbyists in medicine, media and politics. Their role is to portray the pharmaceutical industry as "Mother Theresa" – as a precondition to be able to channel hundreds of billions

13. The human and economic consequences of the "business with disease" have been devastating. Over the past century, hundreds of millions of people have died prematurely from cardiovascular disease and
14. The biggest threat to this giant investment business thriving on maintaining diseases as markets are health care strategies that aim at the prevention and elimination of these diseases. Any preventive health approach is being heavily fought by drug lobbyists because it

15. In few other fields of medicine has more progress been made in recent years than in the field of science based natural health. Micronutrients and other biological molecules have been shown to be
16. To thwart any threat to the pharmaceutical investment industry, the drug companies heavily "invest" in politicians who – in return – promote protectionist legislation and regulations allowing the deceptive "business with disease" to continue – despite its devastating consequences.
17. This factual analysis of the nature of the 'pharmaceutical investment "business with disease"' is a precondition for understanding the very core of the current health care crisis. Without this analysis we will not understand why most of today's diseases continue in epidemic proportions and why – at the same time – public and private budgets are being drained to finance this unscrupulous "business with disease."
18. Most importantly, without this analysis – and without understanding the essence of what is wrong – the people of the United States and beyond will not be able to create a new, effective, safe and affordable health care – with a clear focus on the prevention and elimination of diseases.

\$47,000,000,000,000

Their plan: By 2030 we should pay forty seven trillion dollars to finance the "Business With Disease" – an amount corresponding to 13 times the 2011 U.S. Federal Budget

During a Special Session of the United Nations in September 2011, the stakeholders of the "business with disease" presented their vision of the future of health care to the world. In the coming two decades, according to their plan, the people of the world will have to pay the mind-boggling amount of \$47 trillion to finance the ongoing "business with disease" – in particular with cardiovascular disease, cancer and other chronic conditions. This amount corresponds to no less than thirteen times the 2011 US Federal budget. Their obvious goal: Control our lives and those of generations to come.

other health conditions and trillions in health care costs have been spent for diseases that may have been largely preventable.

highly effective in helping to control cardiovascular disease, cancer, osteoporosis and many other health conditions. This development threatens the drug companies in multiple ways: First, these biological molecules are – unlike high-priced drugs – not patentable and yield much lower profit margins. Secondly, due to their biological nature, these molecules are helping to regulate the metabolism of cells, and – unlike

The above "Laws" of the drug industry are so evident that they can be understood by fourteen year old school children. Even though the health and the future of these children will be directly affected by these "Laws" – they can not yet vote for change. You, the parents and teachers, should take responsibility. We are confident that the information provided on this page will help you make the right decision in the 2012 Presidential Election. We encourage you to forward this information to friends and colleagues who may not know these facts either. If you want to do that via Email, you can find a digital version of this page on our website of our Foundation.
