

According to a recent study published in *The Lancet* medical journal, the number of people diagnosed with diabetes has increased fourfold in the past 35 years¹. There were 108 million people diagnosed with diabetes in 1980 and 422 million in 2014. Based on this alarming statistical finding, the World Health Organization (WHO) selected diabetes as the theme for World Health Day 2016 in order to raise awareness and to prevent and effectively manage this disease.

Micronutrients support Blood Sugar Metabolism

While diabetes has increased globally, it has risen exponentially in the developing countries. This growth is related to the adoption of a sedentary lifestyle, as well as poor dietary habits such as a fast food diet containing high amounts of artificial sugars, which can lead to obesity and other disorders. Obesity, high blood pressure, high cholesterol, and impaired glucose metabolism are now collectively known as metabolic syndrome.

Obesity is one of the most important risk factors for developing diabetes. While a healthy diet is critical for maintaining blood glucose metabolism, our research has proven that appropriate supplementation of micronutrients is equally essential and can reduce the chances of metabolic syndrome developing.

Fructose is a type of sugar that is abundantly present in processed foods. We compared the effects of a specific micronutrient mixture and metformin (a common antidiabetic drug) on immature mice fed a high fructose diet². At the end of seven weeks, the mice receiving the micronutrient mixture had a 4% decrease in serum fructosamine concentration, while the metformin group had a 15% increase in fructosamine. Serum fructosamine

concentration reflects changes in blood glucose over the prior one to two weeks. In addition, the mice in the metformin group had reduced insulin levels while the micronutrient supplemented group showed a restoration of insulin levels to normal. The micronutrient supplementation also showed additional benefits by reducing blood pressure, total cholesterol, and counteracting the effects of high fructosamine, thus reducing the possibility of cardiovascular disease.

The number of people who suffer from diabetes is increasing rapidly. Studies carried out at the Dr. Rath Research Institute show that micronutrients help to prevent and improve this metabolic disease.

Micronutrients support Blood Sugar Metabolism

Sustained high blood sugar levels can lead to serious diabetic complications including atherosclerosis, stroke, kidney failure, neuropathy, impaired wound healing, cataracts, and long-term disability. These problems alone can be major diseases and devastating for a patient's quality of life.

Conventional Medicine is focused on drugs that artificially reduce blood sugar levels. It does not address the root cause of this ever-increasing disease. Diabetes can be a very profitable industry for pharmaceutical companies, as it produces a variety of complications requiring additional treatments. For example, in another recent publication in the British Medical Journal researchers found a significant correlation between one diabetes drug and an increased incidence of bladder cancer³.

The majority of patients affected by diabetes-related disability are between 15-69 years old, which puts a tremendous financial burden on society due to medical expenses and lost workdays. According to The Lancet study, the annual global health-care cost of managing diabetes is estimated

to be \$825 billion, with the largest cost to individual countries being in China, the USA, and India.

With this background, our study findings give hope that prevention and management of high blood sugar is possible without the devastating side effects of prescription drugs.

Important Health Information for All

This information is provided to you courtesy of the Dr. Rath Research Institute. Led by two former colleagues of two-time Nobel Laureate Linus Pauling († 1994) this Institute has become a leader in the breakthrough of natural health research in the field of cancer, cardiovascular disease and other common diseases. The Institute is a 100% subsidiary of the non-profit Dr. Rath Foundation.

The groundbreaking nature of this research poses a threat to the multi-billion dollar pharmaceutical "business with disease." It is no surprise that over the years the drug lobby has attacked Dr. Rath and his research team in an attempt to silence this message. To no avail. During this battle, Dr. Rath has become an internationally renowned advocate for natural health saying, "Never in the history of medicine have researchers been so ferociously attacked for their discoveries. It reminds us that health is not given to us voluntarily, but we need to fight for it."
