CUTTING-EDGE RESEARCH IN NATURAL HEALTH

Curcumin is the most abundant natural phenol (curcuminoid) present in turmeric, the Indian curry spice, and gives it its yellow color. Obtained from the rhizomes of the Curcuma longa plant, turmeric powder is used extensively in South-Asian cooking and food preservation. Due to its various medicinal properties, turmeric is still used in Ayurvedic medicine for skin, respiratory and gastrointestinal ailments, liver disorders, muscle sprains, joint pains and wound healing. In the past few decades, curcumin has been studied to evaluate its anti-oxidant, anti-inflammatory and immune modulation properties.

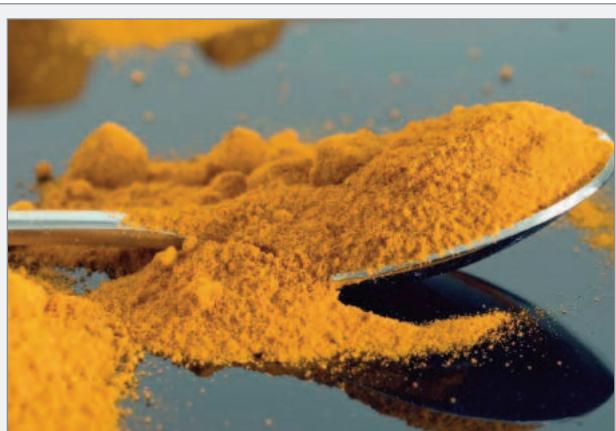

Health Protective Effects of Phytonutrients: Curcumin

As antioxidants, curcuminoid compounds help maintain a healthy cardiovascular system by improving the viscosity of blood and reducing plaque formation in the arteries, both of which obstruct proper blood circulation. Recent studies show that curcumin helps maintain cholesterol levels by reducing low-density cholesterol (LDL) and triglyceride levels¹. In addition, it can reverse insulin resistance in the early stages of diabetes and support the action of some antidiabetic prescription drugs.

By acting as a free radical scavenger curcumin can prevent oxidative DNA damage. This damage to cellular DNA is known to initiate cancer by converting a normal cell into a cancer cell. The anti-cancer properties of curcumin include various cellular mechanisms such as reduction in cancer cell growth, initiation of apoptosis (cancer cell death), inhibition of collagen digesting matrix metalloproteinase (MMP) enzymes and prevention of angiogenesis. By inducing the enzymes involved cell death, curcumin can selectively eliminate cancer cells formed in the organ systems. Moreover, curcumin demonstrates actions very similar to the most recently developed anti-cancer drugs, such as Herceptin, Humira and Avastin etc., all of which have dangerous short- and long-term

side effects². While these drugs are immune suppressors, curcumin has potent immune modulator properties as it can activate the white blood cells (WBCs, or "police cells") and natural killer cells that help in fighting infections.

We studied the efficacy of the combination of curcumin, quercetin, resveratrol and other natural plant derived compounds against melanoma (skin cancer) cells³. This specific mixture exhibited signif-

The phyto-extract Curcumin, extracted from the Curcuma Root, not only gives Asian spice powders their characteristic colour, but is also responsible for numerous health benefits.

Health Protective Effects of Phytonutrients: Curcumin

ificant anti-cancer effects by inhibiting cancer cell growth by 80% and completely blocking the MMP enzymes responsible for the growth and spread of cancer. This combination also induced apoptosis in melanoma cells. The number of dead cells increased with larger doses of the mixture.

Curcumin's anti-inflammatory potential is one of its most commonly researched aspects. It helps reduce inflammation by regulating inflammatory markers, such as cyclooxygenases (COX) enzymes and cytokines. COX-2 enzyme inhibitors are the most frequently prescribed non-steroidal anti-inflammatory drugs (NSAIDs) for symptomatic relief of arthritic pain. However, clinical trials have proven that curcumin supplementation is as effective as ibuprofen and other NSAID painkillers in reducing the symptoms of arthritis. In addition, curcumin possibly reduces the cartilage degradation that is responsible for painful joints.

Due to its unique ability to cross the blood-brain barrier (a protective mechanism that maintains a constant environment around the brain), curcumin is being studied extensively in many types of dementia including Alzheimer's disease. It has been shown that in synergy with vitamin D it can reduce the amyloid plaques that are characteristic of Alzheimer's disease.

With such multi-faceted health promoting actions, curcumin is more than just a "curry spice" and should be included in our daily health regimens.

Important Health Information for All

This information is provided to you courtesy of the Dr. Rath Research Institute. Led by two former colleagues of two-time Nobel Laureate Linus Pauling († 1994) this Institute has become a leader in the breakthrough of natural health research in the field of cancer, cardiovascular disease and other common diseases. The Institute is a 100% subsidiary of the non-profit Dr. Rath Foundation.

The groundbreaking nature of this research poses a threat to the multi-billion dollar pharmaceutical "business with disease." It is no surprise that over the years the drug lobby has attacked Dr. Rath and his research team in an attempt to silence this message. To no avail. During this battle, Dr. Rath has become an internationally renowned advocate for natural health saying, "Never in the history of medicine have researchers been so ferociously attacked for their discoveries. It reminds us that health is not given to us voluntarily, but we need to fight for it."
